

DISPLAY CABINET

Need a little extra space for storage or display? You can build this roomy cabinet as a stand-alone.

The photos at right say it better than I can. Just one look and you can see that this cabinet, built as a stand alone, makes a really attractive and functional storage and display unit. And you can go two ways here. If you like the challenge of building the divided-light glass door, — go for it. But you can save the extra effort, leave off upper door, and still end with a great piece of furniture.

WHAT'S DIFFERENT. The changes you'll need to make in order to build this cabinet as a stand alone, really don't amount to much. It just involves a little work on the bottom skirt and the top cornice. Everything else stays exactly the same.

CORNICE. A quick look at Fig. 1 shows how to fit the cornice molding. On this version you want the molding to wrap around three sides. First add the cornice cap. Just miter the pieces to length and fasten them in place with glue and woodscrews. Then miter the crown molding to fit underneath and glue and nail it in place. This will top the cabinet off nicely.

SKIRT. The changes to the skirt are along the same lines. All I did was

make the skirt continuous around the front and two sides instead of cutting it to fit up to the center cabinet. Fig. 2 shows what to do here and it's all pretty straightforward.
